

STUDENT & DEVELOPER

Milan Fridrich

Turning ideas into technology.

A student at an eight-year grammar school in Brno, with a growing interest in software development, AI, and modern technology.

A student learning to build real, working products.

I'm a student at an eight-year grammar school in Brno, Czechia.

I learn programming and technology mainly by building my own projects and working through real problems as they come up. I like creating things — starting from an idea and following it all the way through to a working product.

Writing code is only part of it. I'm just as interested in how a product gets designed, how its different parts connect, and how to get it into a shape people can actually use.

Right now I'm working on two projects of my own — Petali and Project Pilot — and I pick up new technologies as each one needs them.

When something breaks, I try to understand why before looking for a fix, rather than just copying a ready-made answer. I use AI as a tool for learning, development, brainstorming, problem-solving, and debugging.

Outside of programming, I play badminton, enjoy other sports, and like being outdoors — skiing, cycling, photography, and generally spending time in nature.

What draws me to technology is exactly that: the ability to turn your own idea into something that actually works.

A tool that extends how I think, not a replacement for it.

AI isn't just one more tool on a list for me — it's part of how I learn and build. I use it while working on my own projects, to pick up new technologies faster and understand concepts more clearly.

It's useful for brainstorming, for exploring different approaches to a problem, and for debugging when something isn't working the way it should. I've also started experimenting with AI models directly, including running them locally — and I'm interested in how AI can be built into software itself, not just used alongside it.

AREAS I WORK IN

TECHNICAL SKILLS

SOFT SKILLS

Petali

A computer that speaks a language you understand.

Petali is a personal project that pairs computer monitoring with a visual, living companion on the desktop — turning raw system data into something more approachable and easier to read at a glance.

It started as a simple HTML prototype and grew into a full desktop application. Along the way it pulled me into work well beyond the frontend — system monitoring, application packaging, and deployment — plus a separate marketing site to go with it. It's the project that taught me the most about everything that happens after the interface is done.

Visit Petali → petali.netlify.app

Project Pilot

Stay on course.

Project Pilot is my attempt at building something more ambitious: a full web platform for organizing projects and coordinating the people working on them.

Building it means working across the whole stack — frontend, backend, APIs, a database, authentication — and learning how all of those pieces connect into one working system. Email handling, user verification, permissions, and deployment are all part of it too. It's still evolving; I keep extending and fixing it as I go.

VISION

Just getting started.

This is early — I know that. But I have a clear sense of the direction I want to keep pushing in:

- Go deeper into software development and full-stack engineering
- Build a stronger understanding of AI, and experiment with AI models myself
- Learn more about backends, databases, and software architecture
- Take on increasingly complex projects of my own
- Get better at turning ideas into real, working products
- Keep learning by building, not just studying
- Explore new technologies and look for real, practical uses for them

I'm at the start of this — but I know where I want to keep going.

CONTACT

Say hi.

Open to conversations about projects, collaboration, or just talking through an idea.
